

Debug Session: igs-import-error

Status: [OPEN]

Created: 2026-08-22

Symptoms:

- Importing `Training_Model.igs` produces 3 warnings:
 1. `trimesh.load failed for .igs: file_type 'igs' not supported`
 2. `Unable to infer unit (detected length 11532.2). Keeping raw values as-is.`
 3. `Parameter overall_dimensions.overall_length inferred above max`
- Browser console shows 6 vue-i18n compilation errors with JSON fragments

Hypotheses:

1. Backend running old code without 6000-50000mm unit inference range
2. IGS text parser includes integer metadata as coordinates
3. Frontend caches old inlineJson default value (JSON with braces)
4. vue-i18n processes JSON-like strings from inlineJson or backend response

Plan:

1. Check running backend code vs disk code
2. Examine IGS test file content
3. Restart backend with latest code
4. Add defensive instrumentation for i18n
5. Test import and verify

Evidence Collected:

- Backend PID 32576 running on port 8000
- Frontend PID 47800 running on port 5173
- Disk code has `_infer_unit_scale` with 6000-50000mm range (lines 176-181)
- Screenshot shows "Unable to infer unit (detected length 11532.2)" — matches OLD code behavior
